Definition of BEMIS 1.1.a Import and Export File for the Message Type Shipment Notification

i

About this document

This documentation details the standard in-house data formats, which the BAAN Electronic Message Interchange System BEMIS requires as interfaces to the appropriate EDI subsystem.

The documentation is intended for developers of EDI subsystems, which want to realize an interface with BAAN IV. Furthermore, this documentation helps consultants, who want to implement an interface on this basis, to check the correct data contents of the transfer files. Important fields are identified with both the English and German terms, to assist German-language speakers using this documentation.

This documentation describes the EDI message *incoming* and *outgoing shipment notifications*.

Chapter 1 describes the structure of the interface file, the different record types within the file and the used key fields.

Chapter 2 details every single record type of the message. This chapter contains an overview table with the corresponding BAAN table fields. In addition, every single field is more detailed.

The following section of the documentation details the BAAN ELECTRONIC message in-house format "Shipment Notification".

Available record types of the message type shipment notification

The use of the following record types is conditional (C) respectively mandatory (M), when you transfer information of a shipment notification by means of the messages VDA 4913 ("*Datenfernübertragung von Lieferschein- und Transportdaten (direkter Austausch zwischen Kunde und Lieferant*)")¹ or ODETTE AVIEXP.

The shipment notification message (in-house format) consists of the following records:

ID	Status	Name
SA1	М	Message Overhead (Nachrichten-Vorsatz)
SA2	М	Loading Header (Sendungs-Kopf)
SA3	М	Shipping Note Header (Lieferschein-Kopf)
SA4	М	Shipping Note Position (Lieferschein-Position)
SA5	С	Packaging Position (Packmittel-Position)

¹

Remote transfer of shipping note and transportation data (direct transfer between customer and supplier)

Definition of BEMIS 1.1.a Import and Export File for the Message Type Shipment Notification 1-1

Structure of the shipment notification message (in-house format)

The following record structure is used for the message type BEMIS shipment notification:

Level	Record ID	Status	Name
1	SA1	M/1	Message Overhead (Nachrichten-Vorsatz)
2	SA2	M/1	Loading Header (Sendungs-Kopf)
3	SA3	M/R	Shipping Note Header (Lieferschein-Kopf)
4	SA4	M/R	Shipping Note Position (<i>Lieferschein-</i> <i>Position</i>)
5	SA5	C/R	Shipping Note Packaging Position (Packmittel-Position)

Branching diagram

The branching diagram shows the structure of the message. It indicates the hierarchical relationship between segments. A segment is a set of functionally-related BAAN tables.

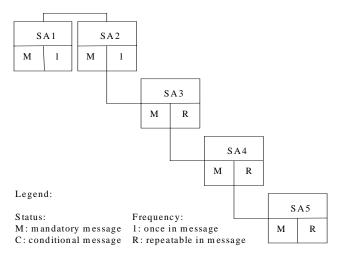

Figure 1, Branching diagram

SA1	Message Overhead
SA2	Loading Header
SA3	Shipping Note Header 1
SA4	Shipping Note Position 11
SA5	Packaging Position 111
SA5	Packaging Position 112
SA4	Shipping Note Position 12
SA5	Packaging Position121
SA3	Shipping Note Header 2
SA4	Shipping Note Position 21
SA5	Packaging Position 211
SA5	Packaging Position 212
SA1	Message Overhead New Message

For example, for one message, which consists of one shipment with two shipping notes with several shipping note positions and packaging positions, the BEMIS file has the following structure:

Shipment notification - key fields

The following structure of the key fields is used to determine the corresponding records of a shipment notification:

Record type	Key field 1	Key field 2	Key field 3	Key field 4	Key field 5	Key field 6
SA1	Message Reference	Network address customer/supplier				
SA2	Message Reference	Network address customer/supplier	Master Bill of Lading No.			
SA3	Message Reference	Network address customer/supplier	Master Bill of Lading No.	Shipping Note No.		
SA4	Message Reference	Network address customer/supplier	Master Bill of Lading No.	Shipping Note No.	Shipping Note Position	
SA5	Message Reference	Network address customer/supplier	Master Bill of Lading No.	Shipping Note No.	Shipping Note Position	Packaging Position

Network directories

The so-called network directories form the basis of the communication between the EDI subsystem and BAAN IV. These directories are established in BAAN. The network basis directories for each network are defined in the BAAN session tcedi0120m000. For the network BEMIS, the basis directories can be indicated in the following way:

/auto3/baanIV/bemis/lieferavi

BAAN will additionally create the following subdirectories:

/auto3/baanIV/bemis/lieferavi/appl_from/ /auto3/baanIV/bemis/lieferavi/appl_to/ /auto3/baanIV/bemis/lieferavi/command/ /auto3/baanIV/bemis/lieferavi/store_recv/ /auto3/baanIV/bemis/lieferavi/store_sent/ /auto3/baanIV/bemis/lieferavi/trace/

The above mentioned directories have the following function:

- 1 .../appl_from/: In this directory, BAAN IV records the outgoing messages which are the defined BEMIS in-house format files. The EDI subsystem can collect them from here.
- 2 .../appl_to/: The EDI subsystem writes the incoming message into this directory in the BAAN IV in-house format.
- 3 .../command/: Directory of the semaphores.
- 4 .../store_recv/: BAAN IV stores in this directory processed incoming messages, if the configuration is accordingly. During this process an additional subdirectory by incoming message file is created which is named with a date and time stamp indicating when the message was moved.
- 5 .../store_sent/: BAAN IV stores in this directory processed outgoing messages if the configuration is accordingly. During this process an additional subdirectory by outgoing message file is created which is named with a date and time stamp indicating when the message was moved.
- 6 .../trace/: BAAN creates under this directory a log of the incoming and outgoing messages in the processing order, if the configuration is accordingly.

For every message type one network directory is used for outgoing and one for incoming messages. This means that one message file contains data for several partners.

Direction File name		Network directory
outgoing	LFAVIS.OUT	/appl_from
incoming	LFAVIS.IN	/appl_to

The file name of the BEMIS in-house format file of the shipment notification, which is being described in this documentation, is defined in the following way:

BEMIS Messages – Conventions

The following general rules apply to a message record in a BEMIS message file:

- 1 The length of a record can vary.
- 2 The message record must consist of all fields, even if not every field contains a value.
- 3 The fields in the file are to be seperated by a ; .
- 4 The text values of the fields have to be put into "".
- 5 The numerical values must not be put into "".
- 6 Every message record starts with "SAx".
- 7 Every message record ends with "SAx_END".

In the following sections you will find the format descriptions for the individual record types of the BEMIS in-house format file. The tables contain the following data:

SHIPM	IENT NOTIFICATION INHOUSE FORMAT			
Pos	FIELD DESCRIPTION	Key	ST	FM

The first block of the table describes the format of a record type:

Pos.	Position of the field in the record		
Field name	Description of the field		
Key	Key fiel	d outgoing (O) / incoming (I)	
ST	Field sta	atus mandatory (M) / conditional (C)	
FM	Field format		
	an14	alphanumerical field with a maximum of 14	
		characters	
	an14	alphanumerical field with exactly 14	
		characters	
	n10	numerical field with a maximum of 10 digits	
	n1	numerical field with exactly 1 character	

When BAAN generates outgoing messages, the numerical fields are written into the in-house format file without leading zeros. For example, for the year "0000" a "0" is written into the BEMIS message file.

Mapping from Application Table Fields (Outcoming)		
Table Field	Action	

The second block of the table describes the corresponding table field for outgoing messages in BAAN IV as well as the possible special actions, which are taken during the processing of the messages.

Mapping to Application Table Fields (Incoming)		
Table Field	Action	

The third block of the table describes the corresponding table field for incoming messages in BAAN IV as well as the possible special actions, which are taken during the processing of the messages.

In the past, there seemed to be some doubts about the way BAAN points out a position within the message file. Here are some additional explanations:

As defined in BEMIS a position within a message file is pointed out using two semikolons.

To draw an example: "SAX"; ...; Position; ...; "SAX_END"

If an position in a BEMIS Message File is not taken by a value (this means the position is empty), the position is pointed out as shown above. Moreover the BAAN EDI Module distinguishes between numerical and alphanumerical data format. If a position defined as numerical is empty the position is pointed out using semikolons. On the other hand emty alphanumerical positions are exported in two way. The first way is to point out a position using the semikolons. The second way BAAN exports empty alphanumerical positions is to write two inverted commans within the position. This depends whether the alphanumerical field existis in BAAN's database or not. Finally we take a look at the following expample:

empty numerical Position:

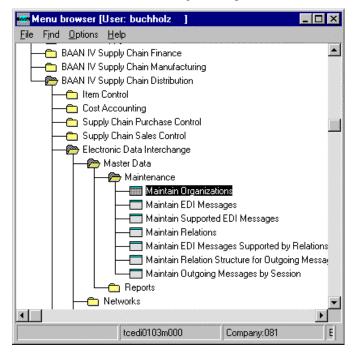

empty alphanumerical Position:

Changing the Date Format

For the BAAN Versions b and c2/3 we have defined a date format using up to 6 numerical digits. Reading this definition, you will find out that the date format has been changed to 8 digits at maximum. With the BAAN Version BAAN IVC4 the delivered BEMIS default file the defaults.edi will be different in this point (in comparison to the versions delivered before). In BAAN EDI there is one global Parameter in order to send out date information including the two digits for the century.

The enclosed screen shots will show you where you will find the responsible parameter.

You have to choose the following menu option:

After you called the session tcedi0103m000 you will see that the entry for the dateformat on form two has been changed to "With Century (YYYYMMDD).

🚟 tcedi0103m000 : Maintain Organizations [(181]		_ 🗆 🗵
File Edit Group Options Order Tools Specie	i <u>H</u> elp		
		T №?	
Form 1 Form 2			
Organization BEM BAAN Electr. Message Int. : ICM Inter Company Messages			
		modify	enum

PLEASE NOTICE:

If you use this option above the date format of every exported message will be changed to 8 digits! This means that the partner system (the translator software) has to able to translate each outgoing message comming with the changed date format!

Following the table overview, every BAAN field is described in a more detailed way, including information about the processing in the EDI subsystem and in BAAN IV.

Changes in Comparison to Version 1.0.a

The following changes has been made:

Comming with BAAN IVC3scc1 the table field formats which are used for the Plant Code and the Delivery Point have been extended (referring to Document U7121B US)

Please notice:

SA3.14 is now an..32 (Delivery Point)

SA3.17 is now an..35 (Plant Code)

Furthermore new positions have been added:

SA2:

SA2.16 Supplier's Plant Code

SA2.17 Load volume

SA2.18 Unit Load Volume

SA2.19 Number of the Transport Partner

SA2.20 The End of record sign has been moved from position 16 to position 20.

SA3:

- SA3.22 Shipping Time
- SA3.23 Invoice Number
- SA3.24 Invoice Date
- SA3.25 Invoice Currency
- SA3.26 Invoice Amount (total)
- SA3.27 Net Weight
- SA3.28 Volume
- SA3.29 Number of Packages
- SA3.30 Gross shipment note weight
- SA3.31 The End of record sign has been moved from position 22 to position 31.

SA4:

- SA4.20 Customer Part Number Revision Level
- SA4.21 Customer Part NumberRevision Level Description
- SA4.22 Customer Part Number Revision Level Effective Date
- SA4.23 Customer Part Number Expiry Date
- SA4.24 Customer Part Number specially for BMW
- SA4.25 Customer order number taken from the delivered schedule
- SA4.26 The End of record sign has been moved from position 20 to position 26.

SA5:

- SA5.16 Packaging identification
- SA5.17 Property identification
- SA5.18 Packaging Typ
- SA5.19 Parent Package Number
- SA5.20 Parent Advice Note
- SA5.21 Parent Package Position
- SA5.22 Qualifier item number
- SA5.23 The End of record sign has been moved from position 16 to position 23.
- PLEASE NOTICE: Using BAAN IVC3scc1 the application is able to import packaging information per EDI.

Shipment Notification – Record description

This chapter describes the record types which are used in the BAAN standard inhouse message format for shipment notifications according to VDA 4913 or ODETTE AVIEXP.

SA1 Message Overhead

2

Status:	Mandatory
Frequency:	Once by message
Description:	This record supports the clear identification of the whole message.

BAAN:	None								
Position	2	Field format	an14	Field status	Μ				
Field name		Message refere	ence	(key field out/in	n)				
Description:	notifica notifica order of The fiel	This field identifies all connected records of one shipment notification. The message reference has to be clear by shipment notification. The numbering helps to control the chronological order of the shipment notifications and the complete transfer. The field consists of a fix part with four characters, the current date in the format YYMMDD and a serial number with four characters							
	The special format is defined in the network parameters in the BAAN table tcedi020. When generating the message reference with the EDI subsystem, the created message reference needs to be specific, that means unique. While storing the message reference BAAN controls whether it is specific.

Detailed description of Shipment Notification, record type SA1 Overhead

	B							
EDI subsystem:	The EDI subsystem generates this number to identify a shipment notification and writes it into all records of a shipment notification.							
BAAN:	Mapping of the BAAN field TFtcedi702.bano to BAAN.							
Position	3 Field format an17 Field status M							
Field name	Network address customer / supplier (key field out/in)							
Description:	This field contains on the outgoing side the network address of the supplier and on the incoming side the network address of the customer.							
Processing outgo	bing							
EDI subsystem:								
BAAN:	BAAN: The network address is stored in the BAAN table tcedi028 'Relations by network' under the corresponding business partner (supplier) and the corresponding network in the BAAN field TFtcedi028.neta. The contents of this field is mapped to the position of the transfer file.							
Processing incom	ning							
EDI subsystem:								
BAAN:	The network address determines the corresponding business partner (customer) and the network in the BAAN table tcedi028 'Relations by network'. This identification is mapped to the BAAN field TFtcedi702.reno.							
Position	4 Field format an17 Field status M							
Field name	Our identification in the network							
Description:	This field contains on the outgoing side our identification (customer) in the network.							
Processing outgo	bing							
EDI subsystem:								
BAAN:	The identification of the customer in the used network is entered in the BAAN table tcedi020 'Networks'. The BAAN field TFtcedi028.neta is mapped to this position.							

EDI subsystem:	Transfer of the value from the message file.							
BAAN:	On the incoming side this field is ignored.							
Position	5 Field format an6 Field status M							
Field name	Message							
Description:	This field contains the code for the identification of the concerned message. The code of the message type shipment notification is 'LFAVIS'.							
Processing outgo	bing							
EDI subsystem:								
BAAN:	The internal message code tcedi001.code 'LFAVIS' of the BAAN table tcedi001 'Supported EDI Messages' is mapped to this position.							
Processing incor	ning							
EDI subsystem:	This field is filled with the fixed value 'LFAVIS'.							
BAAN:	The message code in the BAAN table tcedi001 'Supported EDI Messages' determines, which internal message is connected to this BEMIS shipment notification. In the BAAN table tcedi005 'EDI Messages' is determined for every message, which session (Dll) is used in BAAN to process the BEMIS shipment notification. The message code is mapped to the BAAN field TFtcedi702.mess.							
Position	6 Field format an6 Field status M							
Field name	Organization							
Description:	This field contains the organization (Standard/Norm), which is used for the EDI communication.							
Processing outgo	bing							
EDI subsystem:								
BAAN:	The internal organisation code tcedi003.code 'BEMIS' from the BAAN table tcedi003 'Organizations' is mapped to this position.							

8 8	6									
EDI subsystem:	This field is filled with the fixed value 'BEMIS'.									
BAAN:	Mapping to BAAN field TFtcedi702.orga.									
	The corresponding organization must have been entered into the BAAN table tcedi003.									
Position	7 Field format an35 Field status M									
Field name	Order type									
Description:	on: This field contains a code for the concerned order type.									
Processing outgo	bing									
EDI subsystem:										
BAAN:	In BAAN table tcedi011 there must be an entry for this order type in connection with the appropriate message and organization. The BAAN field TFtcedi011.koor is mapped to this position. It contains the code 4913 (;"4913";).									
Processing incor	ning									
EDI subsystem:	The value 4913 is entered in this field (;"4913";).									
BAAN:	Mapping to BAAN field TFtcedi702.koor.									
	In BAAN table tcedi200 there must be an entry for this order type in connection with the appropriate message and organization.									
Position	8 Field format an35 Field status M									
Field name	Order reference									
Description:	This field contains a code for the order reference.									
Processing outgo	bing									
EDI subsystem:										
BAAN:	The position will not be filled; here (;"";).									
Processing incor	ning									
EDI subsystem:	Transfer of the value from the transfer file.									
BAAN:	Mapping to BAAN field TFtcedi702.msno

SA2 Loading header

Status:	Mandatory
Frequency:	Once by message
Description:	This record type is used to transfer data concerning transportation. It contains information about the shipment identification as well as information about the transport. For a shipment notification this record type is available only once. All the records, which follow up to the next record of the type SA2, refer to the same shipment notification.

Detailed description of Shipment Notification, record type SA4 Shipping Note Position

Processing incoming

Processing incor	ning						
EDI subsystem:	The EDI subsystem generates this number to identify a shipment notification and writes it into all records of a shipment notification.						
BAAN:	Mapping to BAAN field TFtcedi702.bano						
Position	3 Field format an17 Field status M						
Field name	Network address customer / supplier (key field out/in)						
Description:	This field contains on the outgoing side the network address of the supplier and on the incoming side the network address of the customer.						
Processing outgo	bing						
EDI subsystem:							
BAAN:	The network address is stored in the BAAN table tcedi028 'Relations by network' under the corresponding business partner (supplier) and the corresponding network in the BAAN field TFtcedi028.neta. The contents of this field is mapped in the position of the transfer file.						
Processing incor	ning						
EDI subsystem:							
BAAN:	The network address determines the corresponding business partner (customer) and the network in the BAAN table tcedi028 'Relations by network'. This identification is mapped in the BAAN field TFtcedi702.reno.						
Position	4 Field format n9 Field status M						
Field name	MBOL-Number						
Description:	The Master Bill of Lading-Number (<i>Sendungs-Ladungs-Bezugs-Nummer</i>) is the number which the consigner assigns to the shipment/load.

SA5 Packaging position

Status :	Optional
Frequency:	Repeatable by shipping note position
Description:	This record type supports the transfer of position-specific packaging data. It is directly connected to the previous record type SA4 and can occur several times.

Processing incom	ning				
EDI subsystem:	The pos	sition is filled with	h the fixed	l value 'SA5'.	
BAAN:	None				
Position	2	Field format	an14	Field status	Μ
Field name	Messag	ge reference		(key field out/in)
Description:	This field identifies all connected records of one shipment notification. The message reference has to be clear by shipment notification. The numbering helps to control the chronological order of the shipment notifications and the complete transfer. The field consists of a fix part with four characters, the current date in the format YYMMDD and a serial number with four characters.				
	The special format is defined in the network parameters in BAAN table tcedi020. When generating the message reference with the EDI subsystem, the created message reference needs to be specific, that means unique. While storing the message reference BAAN controls whether it is specific.

Detailed description of Shipment Notification, record type SA5 Packaging Position

Processing incoming

8	6
EDI subsystem:	The EDI subsystem generates this number to identify a shipment notification and writes it into all records of a shipment notification.
BAAN:	Mapping to BAAN field TFtcedi702.bano
Position	3 Field format an17 Field status M
Field name	Network address customer / supplier (key field out/in)
Description:	This field contains on the outgoing side the network address of the supplier and on the incoming side the network address of the customer.
Processing outgo	bing
EDI subsystem:	
BAAN:	The network address is stored in the BAAN table tcedi028 'Relations by network' under the corresponding business partner (supplier) and the corresponding network in the BAAN field TFtcedi028.neta. The contents of this field is mapped in the position of the transfer file.
Processing incor	ning
EDI subsystem:	
BAAN:	The network address determines the corresponding business partner (customer) and the network in the BAAN table tcedi028 'Relations by network'. This identification is mapped to the BAAN field Tftcedi702.reno.
Position	4 Field format n9 Field status M
Field name	MBOL-Number
Description:	The Master Bill of Lading-Number (<i>Sendungs-Ladungs-Bezugs-Nummer</i>) is the number which the consigner assigns to the shipment/load.
Processing outgo	bing

Position	18	Field format	n1	Field status	С
Field name		Packaging Ty	p		

Description:	The package type identifies the way a package or container is used, and wheter it is an inner package or outer package.
	<u>Main:</u> A package of type main can be used to pack other (smaller) containers or the deliverable item that is defined in the contract. If package levels are used, only one 'Main' package per level is allowed.
	<u>Auxiliary:</u> These packages are normally collected by a 'Main' package and are therefore unlimited. Auxiliary packages are items such as spacers, lids and so on.
